Assignment 3 - Data Visualization

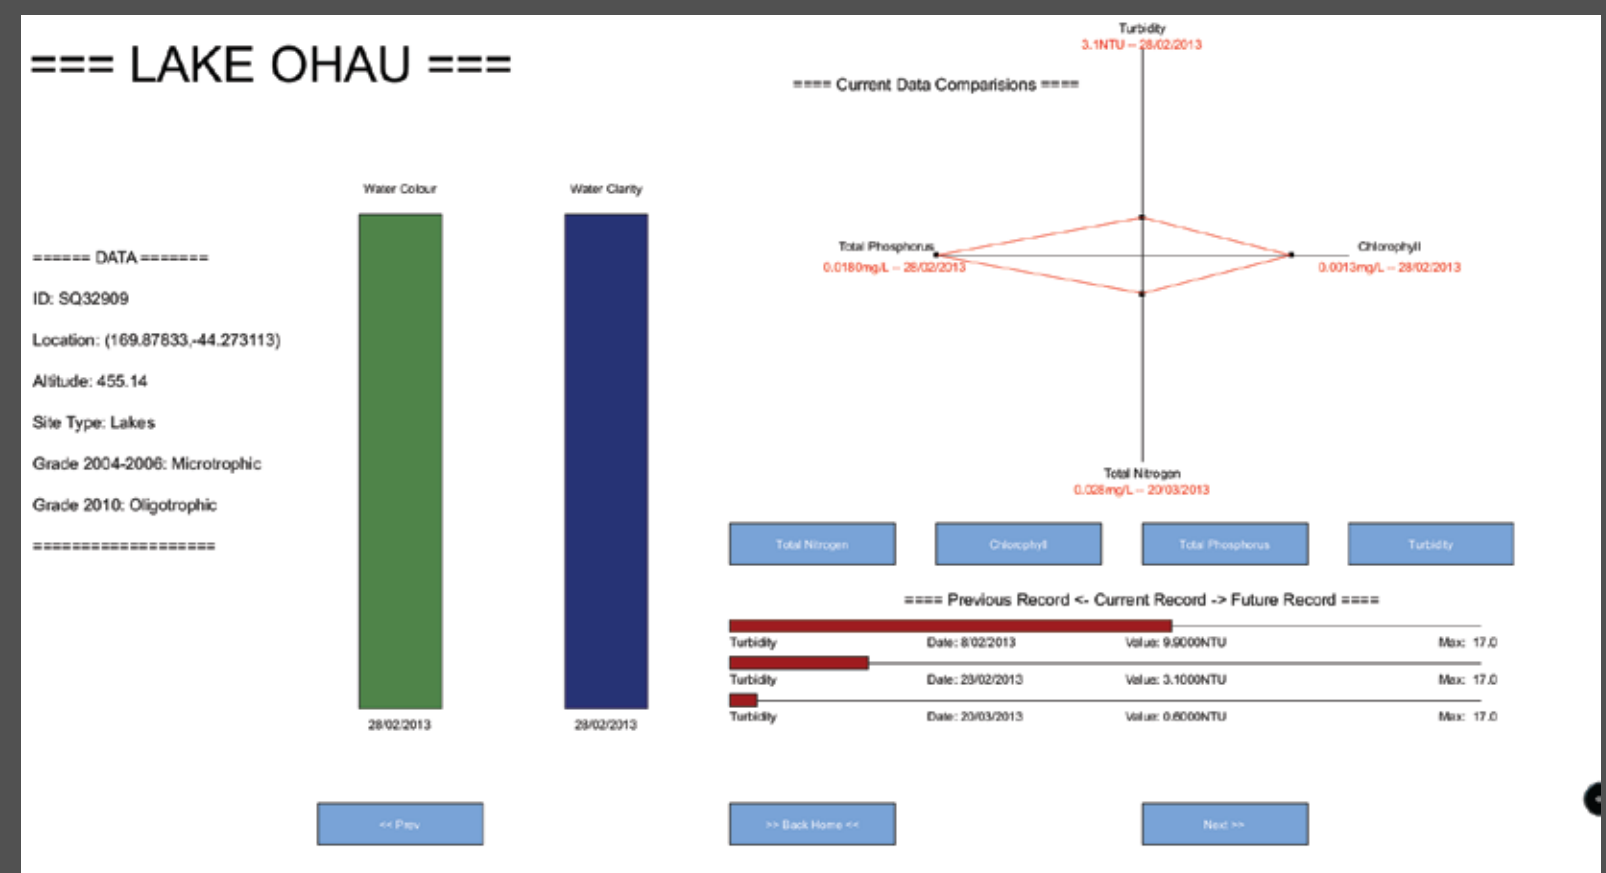

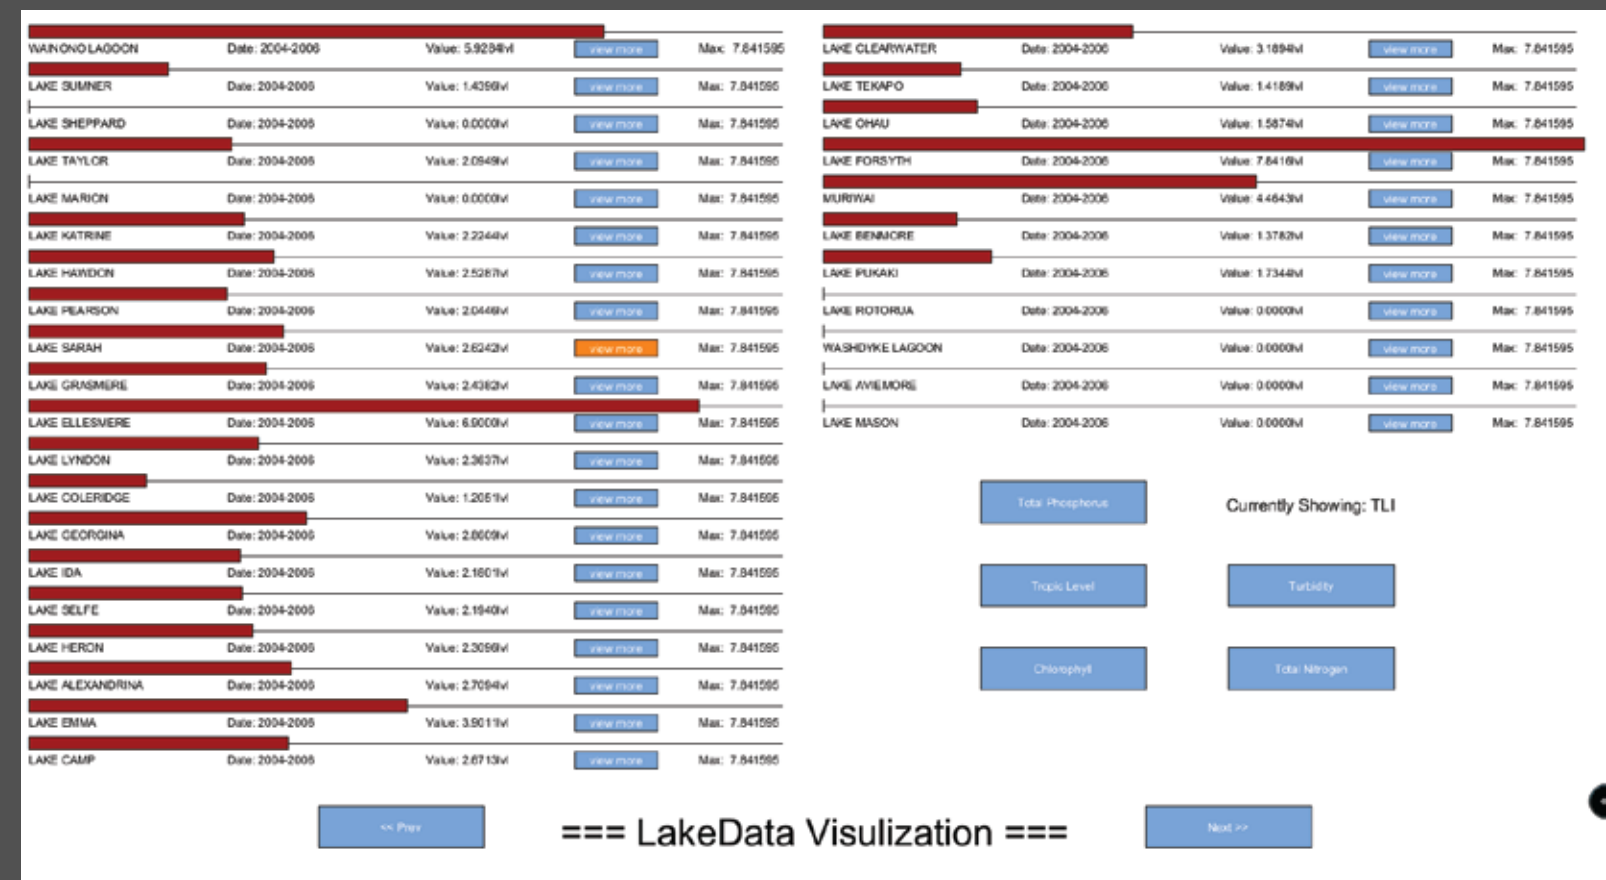

Kelvin David
1345360

Design Description

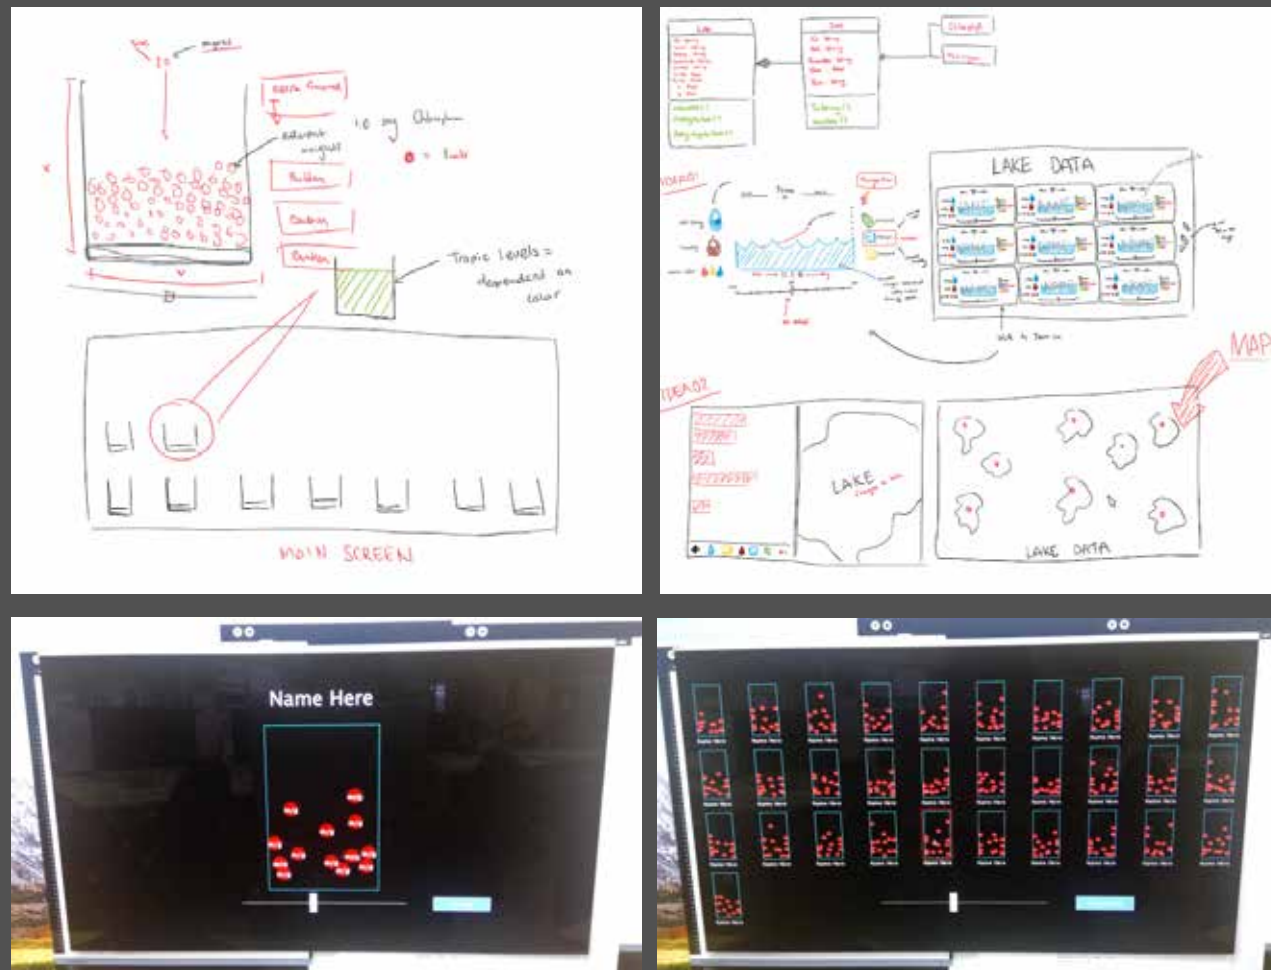

My design for Data Visualization was kept simple and concise vowing for using bar graphs, web graphs and simple color changing bars to represent all of the data needed. The navigation was also kept simple using buttons as the standard form of control, allowing users to navigate around the site and cycle through of the dates of each data set.

The prime reason for the simplicity was due to an inability to be able to complete my first idea due to running into memory errors. So because of time restraint this simple design was chosen as it showed a good amount of information and allowed for more interactivity than normal.

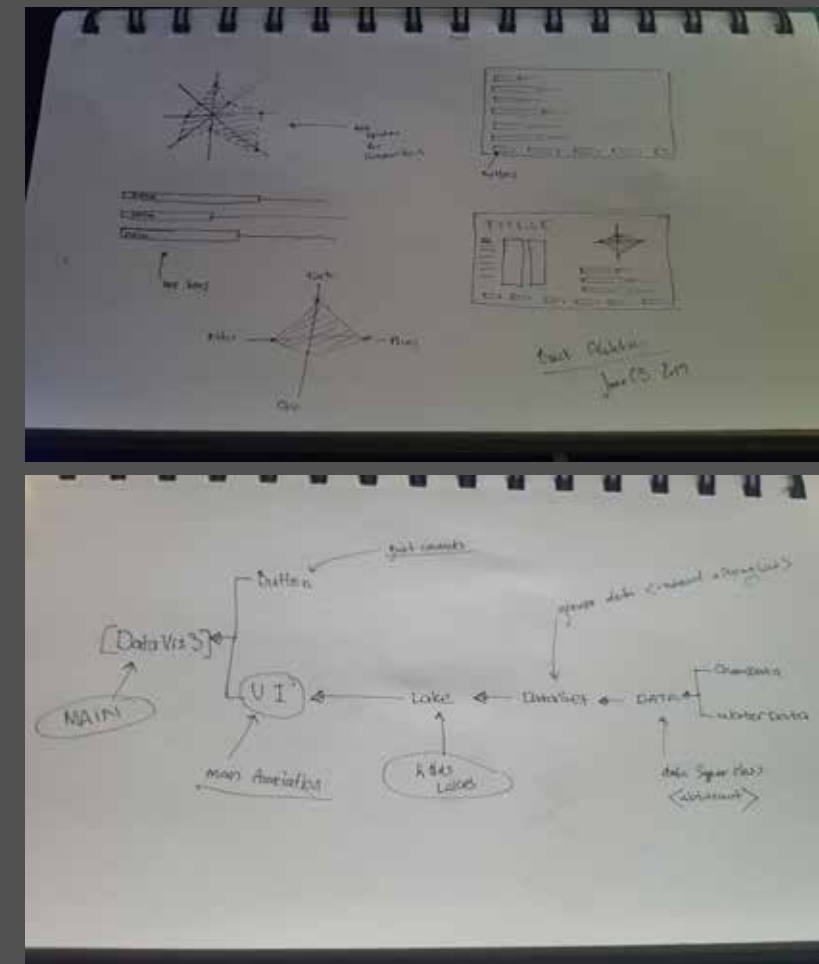

One of the design aspects that I believe stand out would be the spider graph that shows the link between the three main float data. This idea was inspired from a graph shown in a game that recorded playstyle, it's effectiveness is that it can show which element affects the other by looking at the webs shape. Extreme cases will show a large web area, while outliers can be shown by a spike shape.
